

## Shaver Improves Efficiency at Manufacturing Facility

A Canadian manufacturer of resin-based products for concrete protection and rejuvenation sought to increase its efficiency by developing a better way to package their product.

The challenge for Shaver was developing a system to allow the company to keep its packaging process in-house. The solution also needed to ensure that no additional dust would be present in the work environment as the product quality would suffer.

Shaver created a floor to ceiling curtain enclosure that allowed entry for light, but not for dust. A 6000 series power roll-up door was also added to ensure automatic closure after each entry and exit to ensure dust would not enter due to an employee miscue.

The solution allowed the company to keep their packaging onsite resulting in cost savings, a dust free
